1.0 INTRODUCTION

The Douglas Aircraft Company (DAC) C-6 Facility is located at 19503 South Normandie Avenue, Torrance, California (Figure 1). Quarterly groundwater sampling is being conducted in response to the California Regional Water Quality Control Board - Los Angeles Region correspondence to DAC, dated 7 April 1992. This report summarizes laboratory analytical data generated through the chemical analysis of groundwater samples collected during the period of 16-18 March 1993, First Quarter 1993.

2.0 QUARTERLY MONITORING PROGRAM

First Quarter 1993 groundwater sampling was performed in accordance with standard sampling procedures. Static water level depths were measured on 16 March 1993 prior to initiating purging of groundwater from any observation wells. However, several of the water levels measurements were anomalous due an equipment malfunction. Water level measurements were repeated on 9 April 1993.

Groundwater samples were collected from the following wells and chemically analyzed for volatile organic compounds (VOCs) by EPA Method 8240:

WCC-1S, WCC-2S, WCC-3S, WCC-4S, WCC-5S, WCC-6S, WCC-7S, WCC-8S, WCC-9S, WCC-10S, WCC-11S, WCC-12S, WCC-1D, WCC-3D, and DAC-P1.

Table 1 summarizes observation well construction details. Table 2 summarizes the results of chemical analysis of groundwater samples and duplicates. Table 3 summarizes available measured groundwater elevations to date. Copies of laboratory data sheets, groundwater purge and sample forms, and Chain-of-Custody records are included in Appendices A, B, and C, respectively.

2.1 Groundwater Sampling Procedures

Prior to collecting groundwater samples from each well, groundwater was purged by using an electrical submersible pump that was temporarily installed into the observation well. After lowering the pump to the approximate mid-point of the saturated well screen, approximately three to five wetted casing volumes of groundwater were purged from the well until the following groundwater monitoring parameters had stabilized to within 10% of preceding readings: pH, electrical conductivity, temperature and clarity. Purged groundwater was stored onsite in DOT approved 55 gallon barrels pending the results of laboratory analysis of samples.

Following groundwater purging, the submersible pump was removed from the well and a representative groundwater sample was collected using a steam-cleaned stainless steel point-source bailer equipped with top and bottom ball-check valves. The bailer was lowered to the approximate mid-point of the saturated well screen interval and retrieved to ground surface. The contents of the bailer were discharged into three labelled 40-ml capacity vials and preserved with HCL.

2.2 Field QA/QC Procedures

One blind duplicate groundwater sample was collected each day from selected observation wells for Quality Control purposes. Duplicates were collected in four HCL-preserved vials and identified by inserting the collection date after "DW-". For example, a duplicate sample collected on 16 March 1993 was identified as "DW-031693". No further sample identification was provided to the laboratory.

To verify that the groundwater samples were not exposed to analytes during storage and transportation to the analytical laboratory and that decontamination of sampling equipment was satisfactory to prevent cross-contamination of groundwater samples, trip blanks and field (equipment) blanks were chemically analyzed for VOCs. One trip blank was placed in the ice-cooled storage/transportation chest when the first groundwater sample was collected, and transported to the laboratory with the day's samples. Trip blanks were identified following a similar protocol to that used for duplicate water samples. For example, a trip blank prepared on 16 March 1993 was identified as "TB-031693".

Following decontamination of the bailer by steam-cleaning, and prior to collection of groundwater samples from successive wells, a field blank was prepared for laboratory analysis. Each field blank was prepared by pouring Reagent Grade II (Milli-Que) water, prepared by the analytical laboratory, through the bailer and discharge spigot and collecting the rinsate in one 40-ml vial preserved with HCL. Field blanks were identified following a similar protocol to that used for duplicate water samples. For example, a field blank prepared on 16 March 1993 was identified as "FB-031693". The wells sampled before and after field blank preparation were recorded.

All groundwater, duplicate, trip blank and field blank samples were transported in ice-cooled chests to Del Mar Analytical, Irvine, California using U.S. EPA-recommended Chain-of-Custody procedures.

3.0 EVALUATION OF ANALYTICAL RESULTS

3.1 Groundwater Gradient

Groundwater levels were measured prior to sampling on 16 March 1993 and again on 9 April 1993 due to an equipment malfunction during the March sampling event (Table 3 and Appendix B). An estimated potentiometric surface map for the shallow zone is presented as Figure 4. The groundwater gradient in the shallow zone was generally south-southeast with a southerly trough-like depression in the vicinity of observation wells WCC-7S and WCC-12S based on April 1993 measurements. Insufficient data (two wells) are available to define the groundwater gradient in the deeper zone.

3.2 Analytical Data

The results of chemical analysis of groundwater and duplicate samples are summarized on Table 2. Duplicate groundwater samples are indicated by an asterisk and are presented with the "original" groundwater sample. This table includes cumulative analytical data for all monitoring wells and includes detection limits (where available) for the listed chemicals.

Due to the relatively high concentrations of the chemical compounds found in wells 1S, 3S, 4S, 6S, 8S, 12S, 3D, and DAC-P1, the samples collected from these wells were analyzed twice by the laboratory. The first analytical run was an undiluted sample and certain constituents exceeded the calibration range of the instrument. Subsequently the samples were diluted and reanalyzed thus obtaining the quantification of the high concentration constituents. Thus, for each of these samples, two analytical reports are included in Appendix A. Sample reports for the analytical runs with low detection limits indicate some chemicals at "> 4,000 ppb". The chemical concentrations are quantified in the subsequent analytical runs with higher detection limits.

The following observations are noted:

- Data for groundwater samples collected from well DAC-P1, located at the upgradient property boundary, indicate that TCE concentrations have decreased from 29,000 micrograms per liter (ug/L) to 21,000 ug/L coming onto DAC's property. DAC-P1 is screened in the shallow zone.
- Background concentrations of TCE in the shallow zone upgradient well WCC-11S has increased from 83 ug/L to 160 ug/L. TCE concentration in the upgradient well WCC-10S measured from 110 ug/L to 130 ug/L while the TCE concentration in well WCC-2S has decreased from 140 ug/L to 110 ug/L. One additional chemical was detected for the first time in well WCC-3S (Vinyl Acetate 55 ug/L). This is denoted by a double asterisk in Table 2. Vinyl Acetate is a non-priority pollutant. Prior non-detectors are due to higher detection limits in previous sample rounds.
- Groundwater elevation data (Figure 4) and chemical concentration data (Figure 3) indicate that chemical transport in the shallow zone is in a generally southerly direction in the vicinity of buildings 36 and 41. Chemical concentration data from the eastern boundary observation wells (WCC-5S, WCC-9S and WCC-12S) are the same level of magnitude as upgradient "background level" wells (WCC-10S;, WCC-2S). Therefore, the data do not suggest chemical migration offsite from an onsite source.

Kennedy/Jenks Consultants

- VOC concentrations (Table 2), in duplicate samples collected from the deeper zone well WCC-3D indicate a significant increase in the concentration of 1,1,1 TCA. 1,1,1 TCA was also reported significantly higher in groundwater from shallow well WCC-3S while MEK concentrations have dropped significantly. The analytical laboratory has stated their belief that these results are accurate. These data need to be compared with results of future quarters to determine if these concentrations are questionable or accurate before speculating on causes.

Analyses reported as N.D. were not present above the stated limit of detection. Because matrix effects and/or other factors required additional sample dilution, detection limits for this sample have been raised. High Concentration analytes which exceed the calibration range of the detector are reported as >500 µg/L. Due to instrument saturation, the above results are semi-quantitative and not reproducible.

GROUNDWATER SAMPLING RECORD

Facility Name DAC Date 3-18-93

Well Number DAC-PI Well Depth 90' Well Diameter 4" Casting Material PVC

Sampling Crew mw, Beylk, _____, _____,

Type of Pump Submersible Sampler SS Baile

Weather Conditions Clear, 70's

$$\overline{(90 - 70 \cdot 20)} \times 0.65 \times 3 = \overline{39 \text{ gal.}}$$

Reference Well
Volumes
2" well=0.16 gal/ft
4" well=0.65 gal/ft
6" well=1.5 gal/ft
